With the current discussions about taking everything into the cloud, data privacy concerns arise. Smart use of private clouds can be a solution to this as it takes your files, your communication and your collaboration in-house.

protonet. it's yours.

A private cloud powered by protonet gives you all the cloud advantages: the ability to access data from anywhere, instant and easy collaboration, backup services and much more without privacy issues. Our protonet node provides your business with a highly advanced mini server that takes care of your basic server, wifi and storage needs.

With existing private cloud solutions the installation and maintenance costs are prohibitively high, our protonet nodes however allow SMEs access to their own private clouds for just € 149,-* a month. This includes the local hardware with 2x2TB of storage that can easily be expanded, a software license with no user or storage limits, regular software updates and excellent support.

Protonet is on track to provide private clouds for small enterprises. Low costs, minimal administration efforts and transparency are our promises, giving you the power of the cloud and all the advantages of a local it-infrastructure.

*One time setup fee of € 599,-.
